

## Ceiling panel suspension kit

**infracomfort**<sup>®</sup>  
infrared heating

This is a stylish stainless steel product.

Note the size in comparison to the paper clip in the photo

The small fittings at the bottom of the photo attach directly to the ceiling

The longer fittings screw to the back of the panel (either to the frame or T-bar)

The cables pull through the hole as shown to adjust the distance below ceiling

Given their adjustability these are particularly good where

- a. The ceiling is high and panels need to be lower
- b. The fixing points on the ceiling are at different heights (eg sloping ceiling or exposed rafters)
- c. In older buildings where the ceiling may be uneven
